Engineered

E-Sand is manufactured from hard granite stone using state of the art technology, that uses two stage washing and size reduction equipment, to get required grades and sizes of sand. Our commitment is to provide such a sand, the best suits Concrete, Plastering and Masonry.

This is achieved by controlling the oversized particles and also by eliminating the excess superfine particles that are 75 microns (SILT)

- 1) Fine Sand for Plastering and Masonry graded below 2 mm

- 2) Coarse Sand for concrete graded below 4 mm

Particles below 150 microns are reduced significantly.

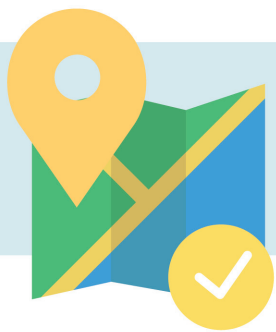

This requires innovation and precise engineering, which is achieved in our system consistently.

Economical

Time is considered as an economical factor for a construction project. Waiting for river sand and buying it from distant places for high prices doesn't prove to be a solution.

So through E-sand, we aim to provide an uninterrupted supply of material, that is irrespective of the seasons and weather conditions, and the best part - We promise a constant price!

As logistics also plays an important role; we are located close to the city and can reach any working site in a short period of time.

Sieve wastage:

E-sand needs no additional efforts to be sieved, as it is free from oversized particles, grit and shell. And is thus graded to the standards of plaster and masonry.

Spillage :

As it is also available in bags (as per the customer requirement) which eliminates the spillage & dumping loss, which accounts to be around 15 - 20%.

EcoFriendly

Nature has a self-balancing law which maintains the ecology for the existence of life. But we are creating an imbalance by mining sand from the rivers and polluting them.

E-sand is an out come of the alternative solution that helps balance our nature and maintain the water bodies through elimination of river-sand mining.
